## General Relativity

Prof. Dr. H.-P. Nilles

Exercises available on: [www.th.physik.uni-bonn.de/nilles/](http://www.th.physik.uni-bonn.de/nilles/) - Exercises/StudentSeminars

### 1. *Non-orthogonal coordinates*

Let us take a Cartesian coordinate system spanned by the unit vectors  $\vec{e}_1$  and  $\vec{e}_2$ , and a non-orthogonal system spanned by  $\vec{e}'_1$  and  $\vec{e}'_2$ . The tilted system's basis vectors are given by

$$\vec{e}'_1 = \vec{e}_1, \quad \vec{e}'_2 = \vec{e}_1 + 2\vec{e}_2. \quad (1)$$

We can write any point  $X$  in the Cartesian system as

$$X = \xi^1 \cdot \vec{e}_1 + \xi^2 \cdot \vec{e}_2 \equiv \xi^a \vec{e}_a \equiv \begin{pmatrix} \xi^1 \\ \xi^2 \end{pmatrix}_\epsilon. \quad (2)$$

The coefficients  $\xi^a$  ( $a = 1, 2$ ) are called *contravariant* coordinates.

- Rewrite  $X$  in the tilted system to obtain the contravariant coordinates  $x^i$  of  $\vec{\xi}$  in terms of the  $\xi^a$ .
- Show that the distance  $s$  from point  $X$  to the origin can be written in the Cartesian system as  $s^2 = \eta_{ab} \xi^a \xi^b$ . What does the *metric*  $\eta_{ab}$  of the Cartesian system look like?
- If we require that distances should not depend on the choice of coordinate system, we can write  $s^2$  as

$$s^2 = \eta_{ab} \xi^a \xi^b = g_{ij} x^i x^j, \quad (3)$$

where we now denote the metric of the tilted system by  $g_{ij}$ .

Compute the metric components  $g_{ij}$ .

- Write the  $g_{ij}$  in terms of the  $\eta_{ab}$  generally. Verify the result of (c).

## 2. Free movement in a gravitational field

We will use the *principle of equivalence* (PE),

*...at any spacetime point in an arbitrary gravitational field it is possible to choose a 'locally inertial coordinate system' such that, within a sufficiently small region of the point in question, the laws of nature take the same form as in unaccelerated Cartesian coordinate systems in the absence of gravity...*

to derive the equations of motion (EOM) for a freely moving particle in a gravitational field. Then we show that this is equivalent to demanding that the particle moves on geodesics in the curved spacetime, which is described by the metric tensor  $g_{\mu\nu}$ .

- Consider the EOM of a particle in the gravitational field of the earth. Use the PE to find a coordinate system in which gravitational forces vanish.
- Write down the EOM for a freely falling particle in a gravitational field.
- Use the PE to derive the EOM in any other coordinate system,

$$\frac{d^2x^\lambda}{d\tau^2} + \Gamma^\lambda_{\mu\nu} \frac{dx^\mu}{d\tau} \frac{dx^\nu}{d\tau}, \quad \text{where} \quad \Gamma^\lambda_{\mu\nu} = \frac{\partial x^\lambda}{\partial \xi^\alpha} \frac{\partial^2 \xi^\alpha}{\partial x^\mu \partial x^\nu}. \quad (4)$$

- Are there any differences in the derivation of Eq. (4), if we consider light (or massless particles)?  
How many of the  $\frac{dx^\mu}{d\tau}$  are independent?
- Show that the *Christoffel symbols*  $\Gamma^\lambda_{\mu\nu}$  can be written as

$$\Gamma^\lambda_{\mu\nu} = \frac{1}{2} g^{\lambda\kappa} \left( \frac{\partial g_{\kappa\mu}}{\partial x^\nu} + \frac{\partial g_{\kappa\nu}}{\partial x^\mu} - \frac{\partial g_{\mu\nu}}{\partial x^\kappa} \right). \quad (5)$$

- Write down the variational principle for geodesics in a space with metric  $g_{\mu\nu}(x)$ .  
Why does it lead to the EOM for a freely falling particle?
- Calculate the EOM from the variational principle of (f).
- How do the EOM change, if we take into account non-gravitational forces?

## 3. Locally varying coordinates

One familiar example of location-dependent coordinates are spherical coordinates

$$\xi^1 = r \cos \theta, \quad \xi^2 = r \sin \theta \cos \phi, \quad \xi^3 = r \sin \theta \sin \phi. \quad (6)$$

Let us write  $(r, \theta, \phi) \equiv (x^1, x^2, x^3)$ .

- Use the invariance of  $ds^2$  under general coordinate transformations to determine  $g_{ij}(x)$  for the spherical coordinates.  
What are the covariant coordinates  $x_i$ ?
- Calculate all Christoffel symbols  $\Gamma^l_{mn}$  for the spherical coordinates.
- What are the EOM for  $r, \theta, \phi$ ?
